IMPORTANT REMINDER

The Medicare Advantage Medical Policy manual is not intended to override the member Evidence of Coverage (EOC), which defines the insured's benefits, nor is it intended to dictate how providers are to practice medicine. Physicians and other health care providers are expected to exercise their medical judgment in providing the most appropriate care for the individual member.

The Medicare Advantage Medical Policies are designed to provide guidance regarding the decision-making process for the coverage or non-coverage of services or procedures in accordance with the member EOC and the Centers of Medicare and Medicaid Services (CMS) policies, when available. In the event of a conflict, applicable CMS policy or EOC language will take precedence over the Medicare Advantage Medical Policy. In the absence of CMS guidance for a requested service or procedure, the health plan may apply their Medical Policy Manual or MCG™ criteria, both of which are developed with an objective, evidence-based process using scientific evidence, current generally accepted standards of medical practice, and authoritative clinical practice guidelines.

Medicare and EOCs exclude from coverage, among other things, services or procedures considered to be investigational, cosmetic, or not medically necessary, and in some cases, providers may bill members for these non-covered services or procedures. Providers are encouraged to inform members in advance when they may be financially responsible for the cost of non-covered or excluded services.

DESCRIPTION

Charged-particle beams consisting of protons or helium ions are a type of particulate radiation therapy that contrast with conventional electromagnetic (i.e., photon) radiation therapy due to the unique properties of minimal scatter as the particulate beams pass through the tissue, and deposition of the ionizing energy at a precise depth (i.e., the Bragg Peak). This type of radiotherapy conforms to the target tumor, minimizing radiation exposure to surrounding healthy tissue. Charged-particle irradiation includes both proton beam therapy (PBT) and helium ion irradiation; however, helium ion irradiation is not currently available in the United States, and therefore this policy focuses on PBT.

MEDICARE ADVANTAGE POLICY CRITERIA

CMS Coverage Manuals*	None
National Coverage Determinations (NCDs)*	None

**Noridian Healthcare
Solutions (Noridian) Local
Coverage Determinations
(LCDs) and Articles (LCAs)***

The LCD for Radiation Oncology: External Beam /Teletherapy (L24354) was retired May 15, 2014; however, Noridian states, *“Retirement does not mean that medical necessity has changed or that the LCD no longer reflects appropriate criteria. Rather, retirement is a reflection of the provider community’s understanding of the medical necessity criteria for the services covered by and compliance with Medicare guidelines on these LCDs.”*

Apply the diagnosis (ICD-9) code instruction within LCD L24354 to determine medical necessity for proton beam therapy. While ICD-10 codes are now used, if a corresponding ICD-9 code is found within the “ICD-9 Codes that Support Medical Necessity” list, then the services can be approved. For all other indications (diagnoses), the service will be considered “not medically necessary.”

- ✓ Radiation Oncology: External Beam /Teletherapy ([L24354](#))

Instructions: Highlight “L24354,” and press Control + C to copy. Click on the LCD L24354 link above. Click “Search” in the list on the left-hand side and enter (or paste) the LCD number into the “ID Search” field. The date of service can be left blank. Click the “Search Now” button.

***Scroll to the “All Versions” section at the bottom of the LCD to access prior versions.

POLICY GUIDELINES

REQUIRED DOCUMENTATION

The information below **must** be submitted for review to determine whether policy criteria are met. If any of these items are not submitted, it could impact our review and decision outcome:

- Identification of the location, extent, and volume of tumor(s) to be treated;
- the critical structure surrounding the tumor(s) in question;
- Applicable diagnosis code(s) and descriptions.

CODING

NOTE: The use of proton beam or helium ion radiation therapy typically consists of a series of CPT codes describing the individual steps required; medical radiation physics, clinical treatment planning, treatment delivery and clinical treatment management. It should be noted that the code for treatment delivery primarily reflects the costs related to the energy source used, and not physician work. Unlisted procedure codes for medical radiation physics, clinical treatment planning and treatment management may be used.

Treatment Delivery:

The codes for treatment delivery will depend on the energy source used typically either photons or protons. For photons (i.e. with a gamma knife or LINAC device) nonspecific radiation therapy treatment delivery CPT codes may be used based on the voltage of the energy source (i.e. CPT codes 77402-77416). When proton therapy is used the following specific CPT codes are available:

Codes	Number	Description
CPT	77299	Unlisted procedure, therapeutic radiology clinical treatment planning
	77399	Unlisted procedure, medical radiation physics, dosimetry and treatment devices, and special services
	77520	Proton beam delivery, simple, without compensation
	77522	Proton beam delivery; simple with compensation
	77523	Proton beam delivery; intermediate
	77525	Proton beam delivery; complex

Note: Codes for treatment delivery primarily reflects the costs related to the energy source used, and **not** physician work.

HCPCS None

***IMPORTANT NOTE:** Medicare Advantage medical policies use the most current Medicare references available at the time the policy was developed. Links to Medicare references will take viewers to external websites outside of the health plan's web control as these sites are not maintained by the health plan.
